\$19

Most prior authorization delays don't happen at submission. They start during the intake call.

Small gaps — missing details, unclear documentation, or requirements not identified upfront — turn into:

- rework
- resubmissions
- constant follow-ups
- delays that get blamed on the payer

This tool is built to fix that — at the point where requests are first captured.

What this helps you do

- Standardize intake calls so nothing gets missed
- Verify information in real time before submission
- Reduce back-and-forth caused by incomplete or misaligned requests
- Catch issues early — before they turn into delays

What's included

- ✓ Structured intake call script
- ✓ Provider, patient, and service verification sections
- ✓ Clinical documentation checklist
- ✓ Payer requirement checkpoints
- ✓ Built-in "red flags" to watch for during calls
- ✓ Common intake mistakes to avoid
- ✓ Quick-reference checklist for daily use
- ✓ Fillable format for real-time use

Who this is for

- Prior authorization intake teams
- Patient access / front-end staff
- Medical office workflows handling authorizations
- Anyone responsible for collecting and submitting auth requests

How it fits into your workflow

Use this during intake calls to ensure requests are:

- complete
- accurate
- aligned with payer expectations

So they don't come back.

Why this matters

Two teams can submit the same volume — and get completely different outcomes.

The difference usually isn't effort.

It's how the process is structured from the start.

If you're seeing...

Requests getting kicked back

Repeated follow-ups

"Fixable" issues turning into delays

This is where the breakdown is happening.

Part of a larger system

This tool focuses on **intake execution**.
